# AMERICAN NATIONAL STANDARDS

By approving this American National Standard, the ANSI Board of Standards Review confirms that the requirements for due process, consensus, balance and openness have been met by B11 Standards, Inc., (the ANSI-accredited standards developing organization). American National Standards are developed through a consensus process. Consensus is established when substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward resolution. This process brings together volunteers and/or seeks out the views of persons who have an interest in the topic covered by this publication. While B11 Standards, Inc., administers the process and establishes procedures to promote fairness in the development of consensus, it does not write the document and it does not independently test, evaluate or verify the accuracy or completeness of any information or the soundness of any judgments contained in its standards or guidelines.

American National Standards are promulgated through ANSI for voluntary use; their existence does not in any respect preclude anyone, whether they have approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards. However, users, distributors, regulatory bodies, certification agencies and others concerned may apply American National Standards as mandatory requirements in commerce and industry.

**Neither B11 Standards, Inc. nor any of the organizations or individuals that assisted in authoring, developing, editing or distributing this standard (B11 Standards, Inc. and such organizations and individuals collectively referred to as the “Contributing Parties”) makes any warranty, either expressed or implied, as to the fitness of merchantability or accuracy of the information contained within this standard. The Contributing Parties disclaim and make no warranty that the information in this document will fulfill any of your particular purposes or needs. The Contributing Parties disclaim liability for any personal injury, property or other damages of any nature whatsoever, whether special, indirect, consequential or compensatory, directly or indirectly resulting from the publication, use of, application or reliance on this document. The Contributing Parties do not undertake to guarantee the performance of any individual manufacturer or seller’s products or services by virtue of this standard or guide, nor does it take any position with respect to the validity of any patent rights asserted in connection with the items which are mentioned in or are the subject of this document. The Contributing Parties disclaim liability for the infringement of any patent resulting from the use of or reliance on this document. Users of this document are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.**

**In publishing or making this document available, the Contributing Parties are not undertaking to render professional or other services for or on behalf of any person or entity, nor are the Contributing Parties undertaking to perform any duty owed by any person or entity to someone else. Anyone using this document should rely on his or her own independent judgment, or as appropriate, seek the advice of a competent professional in determining the exercise of reasonable care in any given circumstances. In addition to conforming to the requirements of this standard, the responsible personnel must also make an independent determination as to whether a machine, activity or condition complies with the applicable legal requirements in the relevant jurisdiction(s).**

B11 Standards, Inc., has no power, nor does it undertake to police or enforce conformance to the requirements of this document. B11 Standards, Inc., does not certify, test or inspect products, designs, or installations for safety or health purposes. Any certification or other statement of conformance to any health or safety-related information in this document shall not be attributable to B11 Standards, Inc., and is solely the responsibility of the certifier or maker of the statement. The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of an American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the Secretariat (B11 Standards, Inc.).

**NOTICE:** This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. You may contact the Secretariat for current status information on this, or other B11 standards.

## FOREWORD

(This Foreword is not part of the requirements of American National Standard B11.27-2024)

This American National Standard was initially created by using the ISO 28881-2013 standard (which is a type-C standard that deals with the safety requirements for electrical discharge machines as a ‘template’ document. ANSI B11.27-2024 has been revised to align with the changes in ISO 28881-2022.

The impetus to create a U.S. safety standard for electrical discharge machines (EDMs) was based primarily on the fact that while these machines are not currently manufactured in the U.S., they remain in widespread use within the U.S., so the B11 SDC agreed to create a type-C American National Standard for EDMs using the ISO standard as a starting point. Two very significant and substantive differences between ISO and ANSI B11 machinery safety standards remain however:

- ISO standards *only* address manufacturer (supplier) requirements whereas ANSI B11 standards address *both* supplier *AND* user requirements;
- ISO standards *only* address machines made after the approval date of the standard whereas ANSI B11 standards address *both* new machines *AND* existing ‘legacy’ machines.

ANSI has rules and procedures regarding the national adoption of ISO standards as American National Standards. The adoption can be:

- **identical** (so noted by containing “IDT” in the alpha-numeric designation, meaning that it is identical in technical content, structure and wording with only perhaps minimal editorial changes to the ISO standard, or;
- **modified** (so noted by containing “MOD” in the alpha-numeric designation meaning some changes beyond those above have been made to the ISO standard but is still maintains the “vice-versa” principle; or
- **not equivalent** which means the national standard is not equivalent to the ISO standard in technical content and structure and the changes have not been clearly identified.

Under these adoption rules, ANSI B11.27 would not qualify as either an “identical” or a “modified” adoption of ISO 28881 because this national standard contains many additional user requirements, as well as guidance on using risk assessment to address legacy (existing) machines. The “vice-versa” principle is not maintained in the sense that while conformance with the requirements in ANSI B11.27 would automatically confer conformance with the requirements in ISO 28881, however, conformance with ISO 28881 requirements would fall short of meeting the additional requirements for the North American market and ones that are contained in ANSI B11.27 since there are no “user requirements” in ISO 28881.

This standard is intended to be used by organizations using the subject equipment or undertaking the design, construction, installation and/or supply of such equipment. This standard also includes information to be provided by the supplier to the user.

### Differences between ISO 28881 and ANSI B11.27

As noted above, ANSI B11.27 deals with user requirements and existing (legacy) machines. The structure of the document represents a sort of ‘hybrid’ structure between the typical ISO document structure specified for safety standards by ISO Guide 78 and the typical (ANSI) B11 structure in order to better accommodate the changes.

### History

This is the second edition of this B11.27 standard, which is a type-C standard. It has been developed to integrate with the broader B11.0 (type-A) standard on general safety/risk assessment and the B11.19 (type-B) standard on risk reduction measures and to align with the changes made to the 2022 edition of ISO 28881.

The B11 series of standards for machines began with safety requirements for power presses in 1922. Since that time, safety standards/requirements for a variety of machines have been developed and continually updated and revised to become a series of some three dozen B11 standards and technical reports. This series contains Type-A standards such as B11.0 and ANSI/ISO 12100 on broad/general safety requirements, Type-B standards such as B11.19 and all of the B11 technical reports dealing with broad safety aspects such

as risk reduction measures, ergonomics, lean/safety integration and noise, and Type-C standards addressing specific machine types or groups or like machines.

### **Effective Date**

The following information on effective dates is informative guidance only, and not a normative part of this standard. The B11.27 subcommittee recognizes that some period of time after the approval date on the title page of this document is necessary for suppliers and users to develop new designs or modify existing designs or manufacturing processes in order to incorporate the new or revised requirements of this standard into their product development or production system.

This subcommittee recommends that suppliers complete and implement design changes for new machines and machinery systems within 30 months of the approval of this standard.

The B11.27 subcommittee recommends that users evaluate whether existing machinery and machinery systems have acceptable risk within 30 months of the approval date of this standard using generally recognized risk assessment methods. If the risk assessment shows that modification(s) is necessary, refer to the requirements of this standard to implement risk reduction measures (risk reduction measures) for appropriate risk reduction.

### **Context (how to read/use this document)**

The writers of this document understand that the reader/user of this American National Standard is unlikely to read it cover-to-cover but instead (for example), might use the Table of Contents as a sort of 'roadmap' to find a very specific topic and then review only that topic. However, the reader/user of this standard is informed that the elements (clauses, subclauses, etc.) of these documents are sequenced and often interrelated in such a way as to state requirements that may very well be dependent on text in a section(s) that precedes the actual requirement. It therefore becomes vital and important for the reader/user of this standard to ensure they understand the depth, range and especially the context of the section or topic in which the actual requirement appears.

### **Inquiries**

Inquiries with respect to the application or the substantive requirements of this standard, and suggestions for its improvement are welcomed, and should be sent to the B11 Standards, Inc. at [www.b11standards.org](http://www.b11standards.org).

## Development

This standard was processed and submitted for ANSI approval by the B11 Standards Development Committee (B11 SDC) on safety standards for machines. Committee approval of this standard does not necessarily imply that all committee members voted for its approval. At the time this standard was approved as an American National Standard, the ANSI B11 SDC was composed of the following member organizations:

Alan Metelsky, FS Eng., **Chair** / Anne Mathias, PE, **Vice–Chair** / David Felinski, **Secretary**

<b>Organizations Represented</b>	<b>Delegate</b>	<b>Name of Representative</b>	<b>Alternate</b>
Aluminum Extruders Council	Mel Mitchell, CSP		Brad Wyatt, CSP
Amazon Robotics	Jeread Sines, B11 LMSS, FS Eng		Josh Owens, B11 LMSS, FS Eng
American Society of Safety Professionals	Ted Sberna, Sr.		Anne Mathias, PE

Toyota Motor Manufacturing North America	Chip Boertlein		Mike Collier, B11 LMSS

## Explanation of the format, and ANSI B11 conventions

The standard uses a two-column format to provide supporting information for requirements. The material in the left column is confined to “Standards Requirements” only, and is so captioned. The right-hand column captioned “Explanatory Information” contains information that the writing Subcommittee believed would help to clarify the requirements contained in the standard. This column should not be construed as being a part of the requirements of this American National Standard. Operating rules (safe practices) are not included in either column of this standard unless they are of such nature as to be vital safety requirements, equal in weight to other requirements, or guides to assist in compliance with the standard.

As in all American National Standards, the term “SHALL” denotes a requirement that is to be strictly followed in order to conform to this standard; no deviation is permitted. The term “SHOULD” denotes a recommendation, a practice or condition among several alternatives, or a preferred method or course of action.

Similarly, the term “CAN” denotes a possibility, ability or capability, whether physical or causal, and the term “MAY” denotes a permissible course of action within the limits of the standard.

### **B11 conventions:**

Normative inter-document or intra-document references are denoted by “See #.##.” Informative inter-document or intra-document references are denoted by “See also, #.##.”

The use of “hard” conversion between metric and English units does not imply a tolerance requirement.

Operating rules (safe practices) are not included in either column of this standard unless they are of such nature as to be vital safety requirements, equal in weight to other requirements, or guides to assist in conformance with the standard.

The ANSI B11 standards generally use the term “OR” as an inclusive disjunction, meaning *one or the other or both*, but on occasion will use the term “and/or” to emphasize the fact that both are fully intended in cases where the Subcommittee believed it was imperative to make that clear.

A distinction between the terms “*individual*” and “*personnel*” is drawn. Individual includes personnel (employees, subcontractors, consultants, or other contract workers under the indirect control of the supplier or user) but also encompasses persons who are not under the direct or indirect control of the supplier or user (e.g., visitors, vendors, etc.).

## INTRODUCTION

The main purpose of most every industrial machine is to process materials. Inadvertent interference with, or accidental misdirection of released energy during production, maintenance, commissioning and de-commissioning can result in injury.

The purpose of the ANSI B11 series of machinery safety standards is to devise and propose ways to eliminate or minimize risks of the potential hazards associated with the required tasks. This can be accomplished either by an appropriate machine design or by restricting personnel or other individuals' access to hazard zones, and by devising work procedures to minimize personnel exposure to hazardous situations. This is the essence of the ANSI B11 series of safety standards. This standard recognizes that zero risk does not exist and cannot be attained. However, a good faith approach to risk assessment and risk reduction should achieve an acceptable risk level.

### Organization and Application of B11 Documents

The B11 standards and technical reports can be associated with the ISO "type A-B-C" structure as described immediately below, and as shown in Figure 1.

- **type-A standards** (basis standards) give basic concepts, principles for design, and general aspects that can be applied to machinery;
- **type-B standards** (generic safety standards) deal with one or more safety aspects or one or more types of engineering controls (safeguards) that can be used across a wide range of machinery;
- **type-C standards** (machinery safety standards) deal with detailed safety requirements for a particular machine or group of machines.

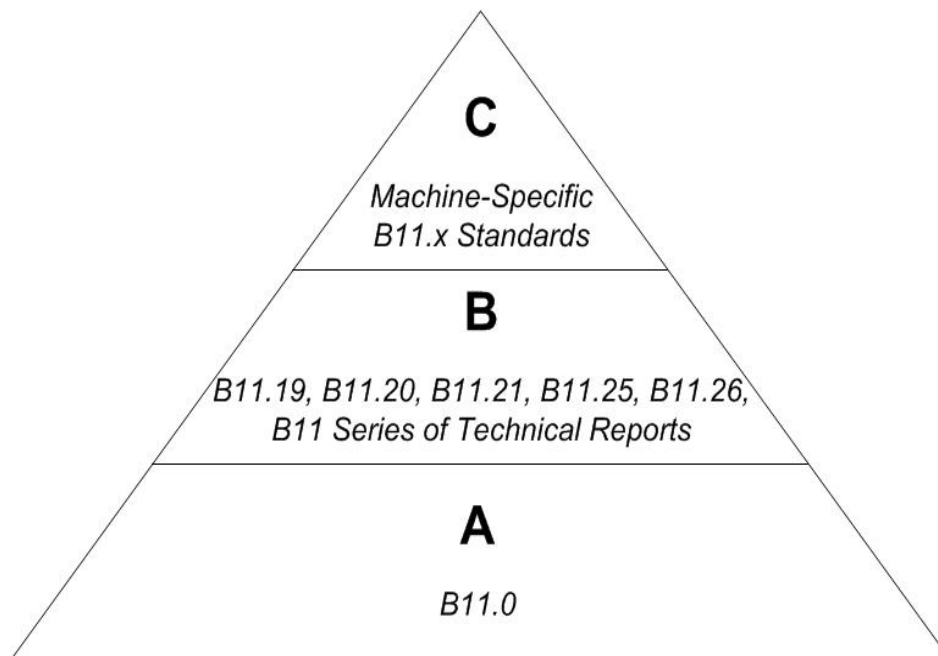

The B11.0 standard on general safety requirements common to ANSI B11 machines is primarily a "type-A" standard in that it applies to a broad array of machines and contains very general requirements. However, in many areas it also contains very specific requirements.

B11.19, B11.20, B11.21, B11.25, B11.26, as well as the entire B11 series of Technical Reports are all typical "type-B" documents addressing general safety elements that can be used across a wide range of machinery (such as B11.19 and B11.26) or as a standard when combining machines (B11.20).

The B11 series of Technical Reports are informative documents that may be generally applied to many different machines, and as such would fall into the "type-B" category.

The machine-specific ("type-C") B11 standards contain detailed safety requirements for a particular machine or group of machines.

The Type-A B11.0 and the type-C (machine-specific) B11 standards are intended to be used concurrently by the supplier and user of machines. When a type-C standard deviates from one or more provisions dealt with by this standard or by a type-B standard, the type-C standard requirement generally takes precedence. Any deviation in conforming to a requirement of any standard should be carefully evaluated and based on a documented risk assessment.

**Figure 1 – Organization of the B11 series of documents**

An overview of each clause of this standard is provided below (clauses 1 through 3 are not shown in Figure 2, for clarity).

- 1) Scope – Provides the boundaries or limits of the standard (i.e., what is/is not included).
- 2) Normative references – Other standards which in whole or in part provide additional requirements when referenced in the normative text (i.e., left-hand column of clauses 4 – 9) of this standard.
- 3) Definitions – Terms used in this standard, together with their definitions (terms used in the same context as are generally understood and commonly used in everyday English are not defined).
- 4) Responsibility – The general responsibilities of the supplier (builder), user, modifier and the user personnel are listed in clause 4 together with the remaining clauses for which they have primary responsibility.
- 5) Risk assessment process – Clause 5 presents the general approach to risk assessment (see B11.0 for further explanation of hazard/task identification and risk assessment/risk reduction).
- 6) Design and construction – It is assumed that the supplier of new equipment to the user will be responsible for the requirements of clause 6, understanding that the user may add to or modify these requirements through the purchase agreement. For existing machinery, the user is generally responsible for the requirements of clause 6.
- 7) Layout, installation, testing and start-up – Although the requirements of clause 7 are predominantly the responsibility of the user, the supplier will normally provide assistance either directly (providing personnel) or indirectly (instruction materials).
- 8) Risk reduction measures – This is normally a shared responsibility but often, either the supplier or the user will provide and/or meet the requirements of clause 8.
- 9) Setup, operation and maintenance – The user is normally responsible for the requirements of clause 9 with possible assistance from the supplier for training.
- 10) Training – The user is normally responsible for the requirements of clause 10 with possible assistance from the supplier for materials or the training itself.
- 11) Decommissioning – This is primarily a user responsibility, however, the supplier shares responsibility for taking this aspect into consideration during the design.

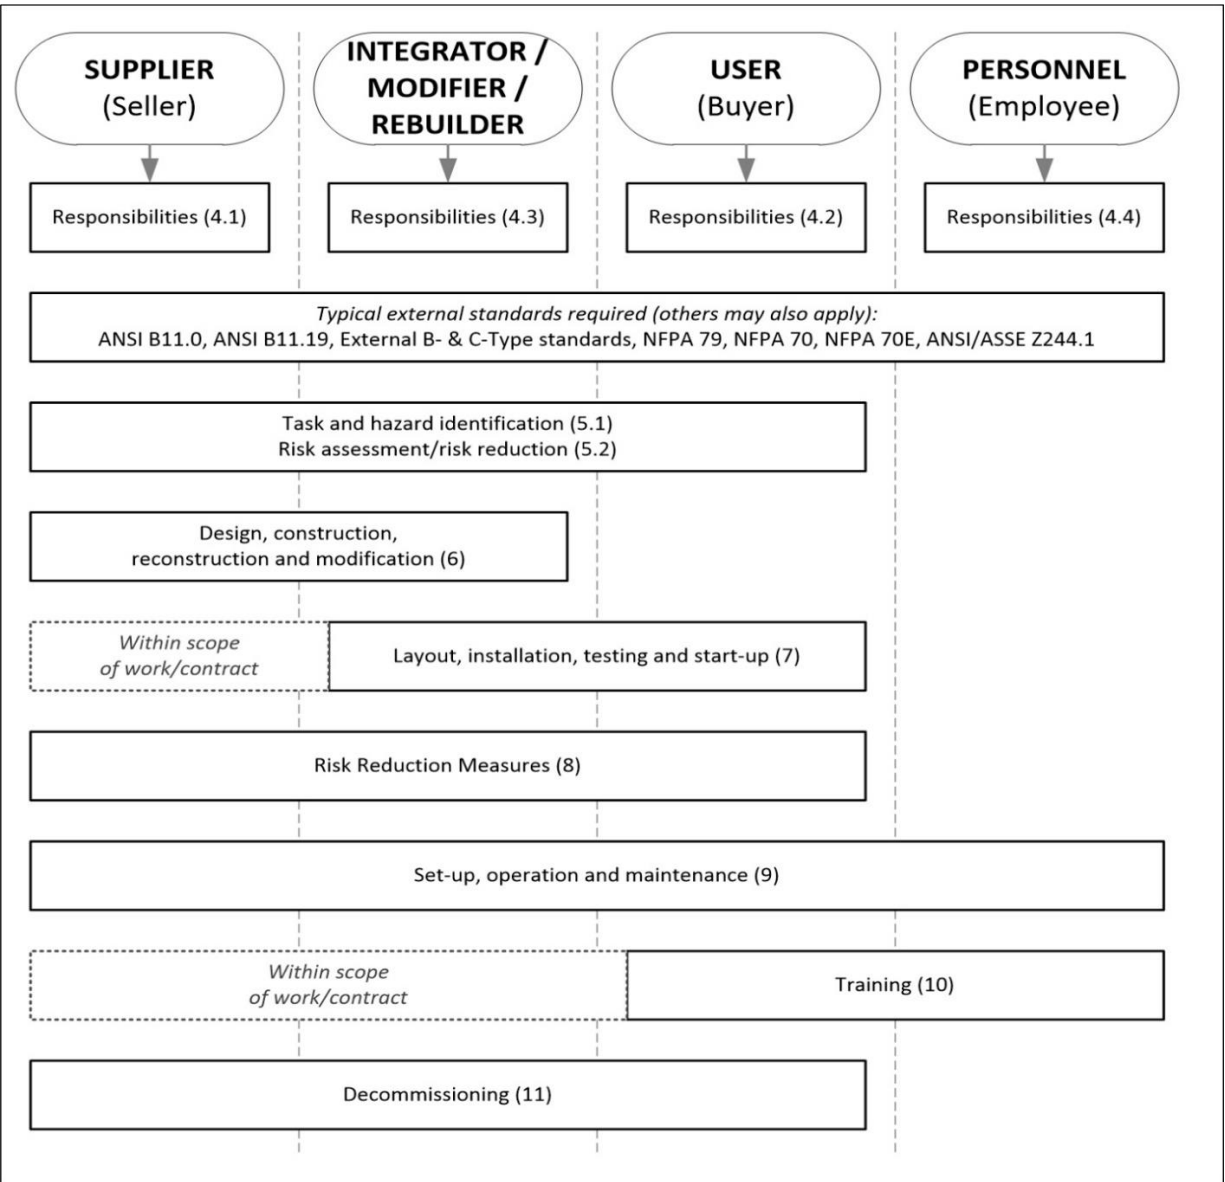

Figure 2 – Typical clause layout of B11 base standards showing the various responsibilities

As of the date of approval of this standard, the ANSI B11 series of American National Standards and Technical Reports on machinery safety consisted of the following documents shown in the list below. The user should check [www.b11standards.org/current-standards](http://www.b11standards.org/current-standards) or a licensed reseller such as ANSI ([www.ansi.org](http://www.ansi.org)) for the current versions of any of these documents. All archival / historical versions of the B11 series of documents are available at [www.b11standards.org/store](http://www.b11standards.org/store).

## STANDARD REQUIREMENTS

## EXPLANATORY INFORMATION

# ***American National Standard – Safety Requirements for Electrical Discharge Machines***

(This column is not part of the requirements of this American National Standard for Machines – Safety Requirements for Electrical Discharge Machines, ANSI B11.27-2024).

## **1 Scope**

This standard specifies safety requirements and/or risk reduction measures, applicable to Electrical Discharge Machine (EDM) equipment and EDM systems, such as:

- a) manually controlled:
  - die sinking;
  - drilling machines.
- b) numerically controlled:
  - die sinking;
  - drilling machines;
  - wire cutting machines.

This standard addresses hazardous conditions during the use and foreseeable misuse in normal environments and non-explosive atmospheres and associated machine tasks including transportation, installation, maintenance, repair and dismantling for removal or disposal.

This standard is also applicable to auxiliary devices essential for EDM processing and includes information to be provided by the supplier to the user.

This standard is not applicable to arc eroding and electro-chemical machining equipment.

## ***E1***

Electrical discharge machining is a machining method primarily used for hard metals or those that would be very difficult to machine with traditional techniques.

EDM typically works with materials that are electrically conductive, although methods for machining insulating ceramics with EDM have also been proposed.

EDM can cut intricate contours or cavities in pre-hardened steel without the need for heat treatment to soften and re-harden them. This method can be used with any other metal or metal alloy such as titanium, hastelloy, kovar and inconel. Also, applications of this process to shape poly-crystalline diamond tools have been reported.

EDM is often included in the "non-traditional" or "non-conventional" group of machining methods together with processes such as electrochemical machining (ECM), water jet cutting (WJ, AWJ), laser cutting and opposite to the "conventional" group (turning, milling, grinding, drilling and any other process whose material removal mechanism is essentially based on mechanical forces).

Ideally, EDM can be seen as a series of breakdowns and restoration of the liquid dielectric in-between the electrodes.

See also, Annex A for several examples of EDMs.
