

Objective Resilience Policies and Strategies

Objective Resilience

Other Titles of Interest

Objective Resilience: Objective Processes, MOP 147, edited by Mohammed M. Ettouney, Ph.D., P.E. (ASCE, 2021). Illustrates some of the objective processes that are used to manage community and asset resilience and provides infrastructure stakeholders with a comprehensive set of practices. (ISBN 978-0-7844-1589-4)

Objective Resilience: Technology, MOP 148, edited by Mohammed M. Ettouney, Ph.D., P.E. (ASCE, 2021). Examines the use of different technologies to enhance community and asset resilience and provides a comprehensive set of practices for infrastructure stakeholders. (ISBN 978-0-7844-1590-0)

Objective Resilience: Applications, MOP 149, edited by Mohammed M. Ettouney, Ph.D., P.E. (ASCE, 2021). Provides different applications that aim to enhance community and asset resilience from the community viewpoint. (ISBN 978-0-7844-1591-7)

MANUALS AND REPORTS ON ENGINEERING PRACTICE

(As developed by the ASCE Technical Procedures Committee, July 1930, and revised March 1935, February 1962, and April 1982)

A manual or report in this series consists of an orderly presentation of facts on a particular subject, supplemented by an analysis of limitations and applications of these facts. It contains information useful to the average engineer in his or her everyday work, rather than findings that may be useful only occasionally or rarely. It is not in any sense a “standard,” however, nor is it so elementary or so conclusive as to provide a “rule of thumb” for nonengineers.

Furthermore, material in this series, in distinction from a paper (which expresses only one person’s observations or opinions), is the work of a committee or group selected to assemble and express information on a specific topic. As often as practicable, the committee is under the direction of one or more of the Technical Divisions and Councils, and the product evolved has been subjected to review by the Executive Committee of the Division or Council. As a step in the process of this review, proposed manuscripts are often brought before the members of the Technical Divisions and Councils for comment, which may serve as the basis for improvement. When published, each manual shows the names of the committees by which it was compiled and indicates clearly the several processes through which it has passed in review, so that its merit may be definitely understood.

In February 1962 (and revised in April 1982), the Board of Direction voted to establish a series titled “Manuals and Reports on Engineering Practice” to include the manuals published and authorized to date, future Manuals of Professional Practice, and Reports on Engineering Practice. All such manual or report material of the Society would have been refereed in a manner approved by the Board Committee on Publications and would be bound, with applicable discussion, in books similar to past manuals. Numbering would be consecutive and would be a continuation of present manual numbers. In some cases of joint committee reports, bypassing of journal publications may be authorized.

A list of available Manuals of Practice can be found at <http://www.asce.org/bookstore>.

DEDICATION

This objective resilience manual of practice is dedicated to the essential workers who are exposed daily to the dangers of the COVID-19 pandemic. Included among the many groups of workers are the following: healthcare personnel, first responders, public safety officers, correction facility workers, food and agriculture, grocery store workers, teachers, US postal service workers, public transit workers, and many more people who work tirelessly to maintain a sense of normalcy in these unprecedented times.

BLUE RIBBON PANEL (In Alphabetical Order)

Joseph Brennan, R.A. (New York), AIA, is an architect and digital practice evangelist who has worked on projects in various capacities for SHoP Architects, Populous, and Gensler. In addition, he is currently an adjunct assistant professor at Columbia University's Graduate School of Architecture, Planning, and Preservation and has taught design technology-focused courses at various institutions in New York. In addition to practice and teaching, Joseph has mentored students at Columbia University, as well as emerging businesses through the New Museum's New Inc. Incubator program.

James Brunetti, P.E., is currently director of operations for Absolute Civil Engineering Solutions in Ft. Lauderdale, Florida. James has more than 35 years of experience in structural mechanics, structural dynamics, design of structures for extreme loadings, fracture mechanics analysis, forensic engineering, and structural failure analysis. He holds a professional degree in engineering mechanics and an M.Sc. degree in structural engineering from Columbia University, as well as a B.Sc. degree in civil engineering from the University of Virginia.

Albert DiBernardo, P.E., ACC, is a consulting engineer. He is the past president of TAMS Consulting, Inc. and the past executive vice president/principal of Thornton Tomasetti, Inc. DiBernardo began his A/E/C career in 1974 and for more than 43 years worked on civil infrastructure projects worldwide, including water resources, airports, bridges, buildings, port facilities, and environmental projects. In the mid-1990s, he began teaching engineering professionals leadership and management and until 2016 served as an adjunct professor in the NYU Tandon School of Engineering graduate program for architects, engineers, and construction professionals. Today, DiBernardo is still serving professionals in the field as a certified

life/career and business coach, business advisor, meeting facilitator, mentor, and teacher.

Ketan Dodhia, P.E., specializes in man-made hazards, blast and progressive collapse at Stone Security Engineering. For nearly 20 years as a structural engineer, Ketan has focused on protective design projects and worked on numerous sensitive public and private sector projects. In addition to working all over the World Trade Center sites, including the National September 11th Memorial and Museum, Calatrava PATH Hub Station, and WTC Towers 2, 3, and 4, Ketan has worked on the New York Stock Exchange, the new Smithsonian National Museum of African American History and Culture, and various US embassies worldwide. As a senior project manager at Stone, Ketan is responsible for project management and leadership of the structural design team on blast-resistant design assignments.

Christopher Doyle is a consultant on homeland security matters, an industry in which he has been immersed for 30 years. Doyle led disaster response and recovery operations both in the field and at the headquarters while with the Federal Emergency Management Agency (FEMA). With the creation of the Department of Homeland Security, Doyle went on to help in the stand-up of the Science and Technology Directorate, directing a portfolio of research and development focused on response and recovery, as well as infrastructure protection. In this role, Doyle led several initiatives to promote the notion of resilience by integrating protection from natural and man-made hazards throughout the built environment, with particular emphasis on critical infrastructure. He was presented with the Institute Award from the National Institute of Building Sciences for his leadership in this area.

Henry Green, Hon. AIA, has held several leadership positions in the building community, including serving as executive director of the Bureau of Construction Codes in the Michigan Department of Labor. Henry was a member of the Building Officials and Code Administrators (BOCA) Board of Directors for 10 years, holding the position of president in 1997. Henry was a founding member of the International Code Council Board of Directors, completing a term as a president in 2006. He served as a member of the National Institute of Building Sciences Board of Directors for 8 years, completing a term as chair in 2003 and serving as a president for more than 10 years. Henry also has served on numerous committees for other building industry organizations and is the recipient of numerous awards. Henry was recognized by the United States House of Representatives for his work as “a tireless advocate for building safety and enforcement of codes.”

Ahsan Kareem, Ph.D., P.E., Dist.M.ASCE, NAE, is the Robert M. Moran Professor of Engineering and director of the NatHaz Modeling Laboratory at the University of Notre Dame. His work focuses on probabilistic characterization of dynamic load effects owing to wind, waves, and earthquakes on tall buildings, long-span bridges, offshore structures, and other structures via analytical and computational methods and fundamental experiments at laboratory and full scale.

Sarbjee Singh, Ph.D., P.E., LEED, is a licensed civil engineer with more than 20 years of industry and research experience, knowledge, and expertise in diverse areas of structural engineering/dynamics related to buildings, bridges, railroad, tunnels, and infrastructure. Currently, Sarbjee is working as Principal Engineer at Metropolitan Transportation Authority (MTA) Construction and Development, New York. His past industry experience includes working with Weidlinger Associates Inc. and AECOM. Sarbjee executed his postdoctorate research in structural control at the Virginia Polytechnic Institute and State University, USA. Sarbjee is currently an active member of the ASCE Technical Committee of Infrastructure Systems with the Transportation & Development Institute and is a member of many professional societies, including ASCE, the Earthquake Engineering Research Institute, and the American Institute of Steel Construction.

AUTHORS (In Alphabetical Order)

Amar A. Chaker, Ph.D., F.AEI, F.EMI, F.ASCE, earned civil engineering degrees from the ENPC in Paris and from the University of Illinois, Urbana-Champaign. He served on the faculty of the USTHB (Algiers), UIUC, and Drexel University. He is now director of the Engineering Mechanics Institute (EMI) of ASCE.

Ryan Colker is vice president of Innovation, International Code Council, and executive director, Alliance for National and Community Resilience, and former vice president, National Institute of Building Sciences. He is a graduate of George Washington University and the University of Florida.

M. Ettouney, Ph.D., P.E., F.AEI, Dist.M.ASCE, has 52 years of consulting experience in many areas, including in very low-to-ultra-high-frequency dynamics and man-made and natural hazards risk and resilience management. Lately, he has been concentrating on the use of game, decision, graph, and probabilistic graph theories (including developing theoretical interactions between these theories) in infrastructure health, progressive collapse, and climate change.

S. Gerasimidis, Ph.D., is an assistant professor of civil engineering at the University of Massachusetts, Amherst. He has published more than 100 technical papers in peer-reviewed international journals and conference proceedings on infrastructure deterioration/collapse, metamaterials, and shell buckling.

Roger J. Grant is executive director, Building Information Management at NIBS and has 30 years of experience in design, construction, and management of the built environment. He earned a BS in construction management and an MBA from Bradley University.

Milagros Nanita-Kennett is the director of research and innovation at the Instituto de Educación Superior en Formación Diplomática y Consular (INESDYC), Ministerio de Relaciones Exteriores (MIREX). Previously, she served as a program manager and senior architect in US DHS S&T as applied to risk and resilience assessment and mitigation. She managed preparedness, response, and recovery for different natural and man-made disasters, environmental sustainability, and climate resilience.

Zackary Kennett, S.E., has over a decade of experience in design and construction administration of buildings, including new construction, renovations, and buildings on existing steel; RC; and masonry structures. He is an expert in interrelationships between asset and community resilience.

Eric Letvin, P.E., Esq., CFM, serves as FEMA's deputy assistant administrator for mitigation. He directs the FEMA's pre- and postdisaster mitigation grant programs that support sustainable, disaster-resilient communities and to avoid or reduce the loss of life, property, and financial impacts of natural hazards.

Chris Mullen, Ph.D., M.ASCE, is an associate professor of civil engineering at the University of Mississippi. Dr. Mullen has 35 years of experience in structural engineering and mechanics and has been active in SEI and EMI. He earned BSCE and MSCE degrees from Rice University and a Ph.D. from Princeton University.

PREFACE

Engineering is a balance between analysis and design. Objectivity forms, mostly, the basis of mathematics and science, which form, mostly, the basis of analysis. Subjectivity forms, mostly, the basis of art, intuition, and imagination, which form, mostly, the basis of design (see [Figure 1](#)). Achieving a proper balance between subjectivity and objectivity during

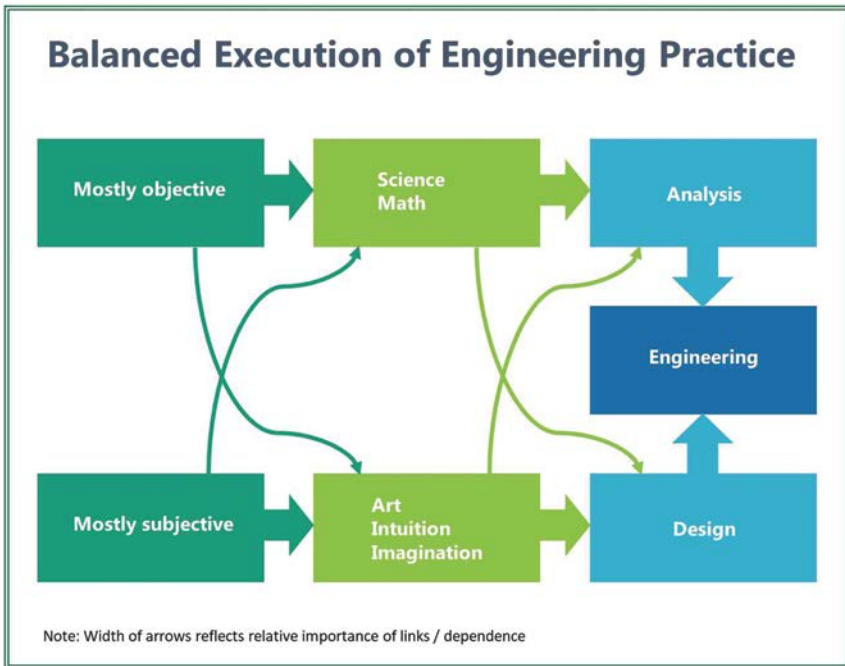

Figure 1. *Balanced Execution of Engineering Practice.*

the engineering process will ensure an optimal product. This is true especially for complex products that have multitudes of different types of components. Admittedly, community and asset resilience is a complex issue, and as such dealing with it from the engineering viewpoint will require a proper balance between objective and subjective processing.

The Objective Resilience Committee (ORC) of the Engineering Mechanics Institute (EMI) of ASCE was formed in 2015 to help achieve a balanced resilience treatment, especially from an objective viewpoint. Soon after its formation, the ORC initiated the development of an Objective Resilience Manual of Practice (OR-MOP) in 2016. The main objective of the OR-MOP is to provide a comprehensive basis of recommended practices that can help enhance community and asset resilience, while emphasizing the objective side of such practices. The developers of the OR-MOP quickly realized that because of the wide-ranging extent of community and asset resilience, the OR-MOP needed to split its focus into four basic categories: (1) Policies and Strategies, (2) Objective Processes, (3) Technology, and (4) Applications.

This book examines policies and strategies related to community and asset resilience. It aims at providing a comprehensive set of practices, after presenting and discussing the basis for these practices. It is recognized that this OR-MOP is limited, given the limiting factors of space and time, especially in view of the aforementioned wide range extent of resilience. However, the developers hope that the OR-MOP can be used as a guide in developing additional MOPs that would address additional aspects of resilience.

The development of the OR-MOP took almost five years. Many worked tirelessly on this project. This includes the authors of the contributing chapters, the external Blue Ribbon Panel, which independently reviewed the manuscript, and the ASCE Publications editors who provided valuable insights and feedback. Special thanks to Dr. Amar Chaker, the EMI director, for his efforts and help without which this OR-MOP could not have been possible.

*Mohammed M. Ettouney, Ph.D., P.E., F.AEI, Dist.M.ASCE
February 2021. West New York, New Jersey*

INTRODUCTION

There are several popular definitions for resilience, including NIAC (2009), the NSC (2011), or the Office of the Press Secretary (2013). For example, NIAC (2009), defined infrastructure resilience as follows:

Infrastructure resilience is the ability to reduce the magnitude and/or duration of disruptive events. The effectiveness of a resilient infrastructure or enterprise depends upon its ability to anticipate, absorb, adapt to, and/or rapidly recover from a potentially disruptive event.

As defined, resilience represents a major issue for society, given the magnitude of disaster costs of different kinds. Recognizing the needs of society to build and sustain resilient assets and communities, stakeholders (e.g., federal, state, and local officials, business owners, professionals, educators, and researchers) devoted considerable effort, time, and expense examining asset and community resilience. Given the wide range of factors that affects resilience, knowledge gaps of the subject are still significant. Similar to most important topics, treatment, handling, and communicating resilience-related matters started with a subjective basis. Objective developments lagged their subjective counterparts; however, these developments have been gaining momentum in the last few years. One primary reason for the elevated interest in resilience-related objective processes is that without adequate objectivity, it will remain difficult to provide optimal policies and strategies that aim at delivering practical asset and community resilience at reasonable costs.

Recognizing the needs for comprehensive and practical objective views of asset and community resilience, the Objective Resilience Committee (ORC) of the Engineering Mechanics Institute (MEI) of ASCE embarked on developing an Objective Resilience Manual of Practice (OR-MOP). The

MOPs of ASCE aim at providing discussions, overviews, developments, and/or best practices concerning different topics. To better attain the stated goals, the OR-MOP endeavors to explore and discuss some of the many issues regarding objective resilience. The OR-MOP also strives to provide best practices sections in all the resilience-related subjects it covers. The OR-MOP attempts to address the intersection of three different areas: resilience (*Re*), civil infrastructure (*CI*), and objective processes (*OP*), see [Figure 1](#). In a set-theory formalism, we can express OR-MOP as

$$OR - MOP \equiv Re \cap CI \cap OP \quad (1)$$

Because of the different nature of the chapters of the OR-MOP, we expect that the extent of their treatment of *OP* would vary.

To cast as wide a net for resilience-related objective issues as possible, which is not an easy task in itself, the OR-MOP is subdivided into four books. Each book will examine objective resilience from different viewpoints. [Figure 2](#) illustrates the general subjects of the four books.

This book, Policies and Strategies, is the first book in the OR-MOP collection. The main objective of the book is to explore different policies and

Figure 1. Confluence of domains of the OR-MOP.

Figure 2. Composition of the OR-MOP.

strategies that can provide for resilient assets and communities. Recognizing that any successful objective process needs to start with the definitions of its subjects, we offer an overview of the many definitions of resilience in the first chapter of the OR-MOP. The chapter also introduces a unifying theory for resilience definitions (TRDs) regarding the interrelationships between the components of some of the popular resilience definitions. The TRD should streamline objective applications of resilience. Chapters 2 through 6 provide different outlooks of policies and strategies, as applied to resilience. Chapters 2 through 4 explore relevant policies and strategies of organizations, codes and standards, and the federal government, respectively. Chapter 5 presents a review of objective modeling considerations from policy/strategy viewpoints. Chapter 6 offers a discussion of resilience management. All chapters will propose a set of recommended practices at the conclusion of each chapter. See [Figure 3](#) for a map of the organization of the book.

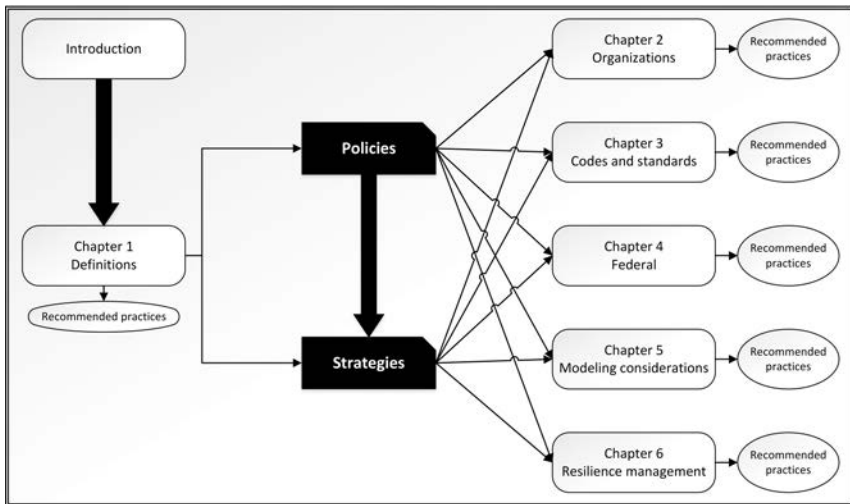

Figure 3. Map of this book (policies and strategies).

The intended readers of this OR-MOP include all civil infrastructure stakeholders, which may broadly include the following:

- Public and private civil infrastructure organizations (transportation, water resources, bridges, health care, and so on);
- City, county, and state officials;
- Emergency managers;
- Public safety personnel;
- Facility managers;
- Security consultants;
- Engineers, architects, and other design professionals;
- Educators; and
- Researchers.

Although there are wide range of objective complexities covered in the chapters, a deep knowledge of these objective topics is not required to achieve familiarity and benefit from the content. For readers who may not have the time to go in depth in each subject matter, it is suggested that they initially become familiar with the “recommended practices” at the end of each chapter. Each reader can then look at the chapter in depth to learn the reasonings/sources of these recommended practices.

Note that ASCE Manuals of Practice (MOPs) are developed by ASCE technical committees, such as the ORC, under the direction of an ASCE sponsor such as the Engineering Mechanics Institute (EMI). The distinguishing characteristic of an MOP, including this one, is that each one undergoes peer review by a Blue Ribbon Panel of experts before final

approval is sought from the appropriate executive committee. Thus, the peer review by the Blue Ribbon Panel gives added weight to the MOP.

Mohammed M. Ettouney, Ph.D., P.E., F.AEI, Dist.M.ASCE

CHAPTER 1

ON THE DEFINITION OF RESILIENCE

S. Gerasimidis, M. Ettouney

1.1 INTRODUCTION

Natural and human-made hazards in recent years have led to disasters causing significant damage to communities and their infrastructure. The associated losses with these disasters have illustrated the need for designing civil infrastructure that can withstand such events with minimum disruption. The approach of investigating civil infrastructure against disasters in terms of losses and consequences, continuation of operations, and time to recovery (The terms “time to recovery,” “rapid recovery,” or just “recovery” have been used by different authors. We will use them interchangeably for the remainder of this chapter.) has been widely known as “infrastructure resilience.” However, because several researchers and agencies have approached infrastructure resilience from various viewpoints, it is considered beneficial to provide a closer look at the definition of the term “resilience.” This is the main objective of this chapter and one of the goals of the current Manual of Practice.

This chapter is not intended to be a complete inventory of all the definitions of resilience that have appeared in the literature. Not only would this be a pointless long inventory of definitions, it is the authors’ opinion that it would lead to an outcome opposite of the intended one. The intention of the authors is to highlight some important definitions and identify common patterns overarching almost all definitions. Along these lines, this chapter does not aim at adding one more definition to the ones that already exist in the literature. The approach adopted herein is to provide useful key properties and common components among all measurements and definitions of resilience that can describe the concept of resilience for infrastructure systems, distinguishing resilience from
