# National Electrical Safety Code<sup>®</sup>

## C2-2012

3 Park Avenue, New York, NY 10016-5997, USA

# National Electrical Safety Code®

Secretariat  
Institute of Electrical and Electronics Engineers, Inc.

Approved 14 April 2011  
Institute of Electrical and Electronics Engineers, Inc.

Approved 3 June 2011  
American National Standards Institute

## 2012 Edition

**Abstract:** This Code covers basic provisions for safeguarding of persons from hazards arising from the installation, operation, or maintenance of (1) conductors and equipment in electric supply stations, and (2) overhead and underground electric supply and communication lines. It also includes work rules for the construction, maintenance, and operation of electric supply and communication lines and equipment. The Code is applicable to the systems and equipment operated by utilities, or similar systems and equipment, of an industrial establishment or complex under the control of qualified persons. This Code consists of the introduction, definitions, grounding rules, list of referenced and bibliographic documents, and Parts 1, 2, 3, and 4 of the 2012 Edition of the National Electrical Safety Code.

**Keywords:** communications industry safety; construction of communication lines; construction of electric supply lines; electrical safety; electric supply stations; electric utility stations; high-voltage safety; operation of communications systems; operation of electric supply systems; power station equipment; power station safety; public utility safety; safety work rules; underground communication line safety; underground electric line safety

## **Recognized as an American National Standard**

An American National Standard implies a consensus of those substantially concerned with its scope and provisions. An American National Standard is intended as a guide to aid the manufacturer, the consumer, and the general public. The existence of an American National Standard does not in any respect preclude anyone, whether he has approved the standard or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standard. American National Standards are subject to periodic review and users are cautioned to obtain the latest editions.

## Foreword

This foreword is not a part of Accredited Standards Committee C2-2012, National Electrical Safety Code.

This publication consists of the parts of the National Electrical Safety Code<sup>®</sup> (NESC<sup>®</sup>) (Accredited Standards Committee C2) currently in effect. The former practice of designating parts by editions has not been practical for some time. In the 1977 Edition, Parts 1 and 4 were 6th editions; Part 2 was a 7th edition; Part 3 was a revision of the 6th edition; Part 2, Section 29, did not cover the same subject matter as the 5th edition; and Part 3 was withdrawn in 1970. In the 1987 Edition, revisions were made in all parts, and revisions to all parts have been made in subsequent editions. It is therefore recommended that reference to the NESC be made solely by the year of the published volume and desired part number. Separate copies of the individual parts are not available.

Work on the NESC started in 1913 at the National Bureau of Standards (NBS), resulting in the publication of NBS Circular 49. The last complete edition of the Code (the 5th edition, NBS Handbook H30) was issued in 1948, although separate portions had been available at various times starting in 1938. Part 2—Definitions and the Grounding Rules, 6th edition, were issued as NBS Handbook H81, ANSI C2.2-1960, in November 1961, but work on other parts was not actively in process again until 1970.

In 1970 the C2 Committee decided to delete the Rules for the Installation and Maintenance of Electric Utilization Equipment (Part 3 of the 5th edition), now largely covered by the National Electrical Code<sup>®</sup> (NEC<sup>®</sup>) (NFPA 70<sup>®</sup>, 2011 Edition), and the Rules for Radio Installation (Part 5 of the 5th edition) from future editions.<sup>①</sup> The Discussion of the NESC, issued as NBS Handbook H4 (1928 Edition) for the 4th edition of the NESC and as NBS Handbook H39 for Part 2 of the Grounding Rules of the 5th edition, was not published for the 6th edition.

The 1981 Edition included major changes in Parts 1, 2, and 3, minor changes in Part 4, and the incorporation of the rules common to all parts into Section 1. The 1984 Edition was revised to update all references and to list those references in a new Section 3. Converted metric values, for information only, were added. Gender-related terminology was deleted. Section 1—Introduction, Section 2—Definitions, Section 3—References, and Section 9—Grounding Methods, were made applicable to each of the Parts 1, 2, 3, and 4.

The 1987 Edition was revised extensively. Definitions were changed or added. Requirements affecting grounding methods, electric supply stations, overhead line clearances and loading, underground lines, and work rules were revised.

The 1990 Edition included several major changes. General rules were revised. A significant change to the method for specifying overhead line clearances was made and the rationale added as Appendix A. Requirements for clearances of overhead lines from grain bins and an alternate method for determining the strength requirements for wood structures was added. Rules covering grounding methods, electric supply stations, underground lines, and work rules were changed.

In the 1993 Edition, changes were made in the rules applicable to emergency and temporary installations. In Section 9 and Parts 1, 2, and 3, rules were extended or clarified to include HVDC systems. The requirements for random separation of direct-buried supply and communications systems were modified for consistency and clarity, as was the rule in Part 4 on tagging electric supply circuits.

In the 1997 Edition, the most notable general change that took place is that numerical values in the metric (SI) system are shown in the preferred position, with customary inch-foot-pound values (inside parentheses)

<sup>①</sup> Information on references can be found in Section 3.

following. A bibliography, Appendix B, which consists of a list of resources identified in notes or recommendations, was added. Changes were made to rules affecting grounding, electric supply stations, and overhead lines, particularly with regard to clearance rules applicable to emergency and temporary installations. Strength requirements contained in Sections 24, 25, and 26 were revised completely. Underground line requirements for random separation for underground lines of direct-buried cables were modified. The requirement for cable identification marking by means of sequentially placed logos was introduced. Work rules added a requirement that warning signs and tags comply with applicable ANSI standards, tagging requirements were clarified with regard to SCADA, and extensive requirements for fall protection were added.

In the 2002 Edition, several changes were made that affected all or several parts of the Code. Particularly, this edition clarifies interfaces between the NEC and NESC with regard to Code jurisdiction in the area of street lights and area lights. Also included is clarification for situations between utility workers and their authorized contractors and installations on industrial complexes.

The major revisions for the 2007 Edition included grounding, moving sag calculations to Section 23, moving guy and span wires insulator rules to Section 21, phasing out of the alternate method for load factors and strength factors, flammable materials transported, phase-to-phase cover-up, and minimum approach distance tables.

In the 2012 Edition, major changes include an updated scope, application, and definitions; greatly simplified minimum approach tables and voltage exposure for arc flash; the addition of K factor for wire attention; and added clarification of the ungrounded portions of guys and swimming pools.

The Scope, Application, and Definition rules were extensively revised in 2012 to better reflect the historical application of the NESC—in large measure to clarify the relative applicability of the NESC versus the NEC. The changes in language in Rules 010—Purpose and 011—Scope are not changes in either scope or purpose; they are clear statements of the almost 100-year application of the requirements of the NESC to the specified circumstances. Additional rules were changed for clarity or to support changes made in other sections of the Code.

In Rule 091, revisions were made to clarify where rules require conductors or equipment to be effectively grounded, meeting the requirements of Section 9, plus the definition of *effectively grounded* must be met.

In Rule 094B7, the length and thickness requirements for using a directly embedded metal pole as an acceptable grounding electrode were deleted. Text was added to specify the distance required for a supplemental ground electrode to be installed with an embedded metal pole. Also, the Exception within the Rule added the words “or type metal” that recognize other length, configuration, and material may be allowed if supported by a qualified engineering study.

In Rule 099B, the grounding electrode conductor for grounding communication apparatus was changed from an AWG No. 14 to AWG No. 6.

The revisions in Part 1 consisted of improving Rule 110A2 to reduce clearance to live parts for an impenetrable fence and simplifying the Table 111-1 list of illumination levels for generating stations and substations.

Additional revisions were also made as follows:

- Updating the standard revision dates that contain information regarding safety signs.
- Storing material, equipment, and vehicles in supply stations.
- Outdoor lighting at unattended stations (not required).

- Noting that permanently installed fire-extinguishing equipment is not a requirement.
- Use of “taut-string distance” measurements for vertical clearances to energized part.

Rule 214A5 was revised; multiple change proposals attempted to add consistency to the application of the terms *grounded* and *effectively grounded*. Subcommittee 4 retained both terms and retained the requirement that guys be effectively grounded. Subcommittee 4 also revised Rules 215B1 and 215B2, applied a revision to the application of guy insulators, and clarified the voltage between line conductors.

A footnote to Table 251-1 was inserted to clarify the application of the K factor for wire tensions when a messenger supports multiple conductors using splices. It states that when each conductor is separately loaded with ice and wind as described in Rule 251A3b, the K factor should be applied to all cables.

Rule 261H1 addresses tensions of overhead supply conductors and shield wires. One change proposal added tension limits when Rule 250C and Rule 250D loads apply. Similar to what already existed for splices and deadend fittings, conductors and shield wires will now be limited to 80% of the rated breaking strength when those extreme load conditions are applied along with a load factor of 1.0. Another change in the same rule modified the application of the secondary conductor tension limits from 16 °C (60 °F) to the applicable temperature listed in Table 250-1 for Rule 250B district loads. Reducing the temperatures at which tension limits are applied is in line with recommendations from conductor manufacturers and will reduce the risk of conductor damage due to aeolian vibration.

Rule 313 was reworded to include the recording and correction of conditions, not just defects, that affect compliance with the Code. In Rule 314B, the voltage level for grounding riser guards and ducts was deleted. Rule 320B5 now requires not less than 300 mm (12 in) separation from gas and other lines that transport flammable materials. New Rule 323E5 requires clearances based on Rule 110A2 for aboveground vaults with ventilation opening not protected with baffles or louvers. Figure 323-1 and Figure 323-2 were revised to comply with the latest figures in ASTM C857. The title for Section 35 was revised to include cable in duct not part of a conduit system. Recommendations concerning color coding for direct-buried cables and duct not part of a conduit system were added to Rules 350F and 350G. Installation rules for cable in duct were included in Rule 352. An Exception was added to Rule 354A2 to allow less than 300 mm (12 in) separation between supply conductors operating at not more than 300 V between conductors and gas and other lines that transport flammable materials where supplemental mechanical protection is provided. New Rule 355 contains rules for duct not part of a conduit system. Rule 384 was rewritten to require bonding between aboveground metallic communication and supply enclosures only.

Two significant changes were made to the work rules in Part 4, specifically in the Rule 441 minimum approach distanced tables, and also in Rule 410A3 on arc flash exposure. Revisions to IEEE Std 516™-2009 (NESC’s source for calculated minimum approach distances) required changes to be made to the minimum approach distances in Part 4. Prior NESC editions included several tables containing minimum approach distances based on voltage levels and overvoltage levels. In the 2012 Edition, the minimum approach tables have been greatly simplified (accurate to the current IEEE 516 calculations) providing distances at the accepted historic maximum overvoltage levels. An engineering study of circuit overvoltage will have to be completed to use a reduced minimum approach distance.

Rule 410A3 was revised to recognize exposures at less than 1000 V. Significant testing was conducted by two separate major utilities and a research institute, providing the opportunity to establish appropriate incident energy levels for many common industry applications. The result of the review of the testing supported the development of new Table 410-1 that establishes arc energy thresholds for different equipment/exposures at voltage levels below 1000 V.

Table A-1 of Appendix A was revised only in the manner of presentation by the Overhead Clearances Subcommittee. However, the extreme wind calculations of Appendix C were revised by the Overhead Strengths and Loadings Subcommittee to reflect changes in Rule 250C.

Substantive changes in the 2012 Edition are identified by a bar in the left-hand margin. In several cases, rules have been relocated without substantive changes in the wording. In these cases, only the rule numbers have been indicated as having been changed.

The Institute of Electrical and Electronics Engineers, Inc., was designated as the administrative secretariat for C2 in January 1973, assuming the functions formerly performed by the NBS. Comments should be sent to the Secretary, National Electrical Safety Code Committee, through the following Contact Form:

Secretary  
National Electrical Safety Code Committee  
Institute of Electrical and Electronics Engineers, Inc.  
<http://standards.ieee.org/contact/form.html>

A representative Committee on Interpretations has been established to prepare replies to requests for interpretation of the rules contained in the Code. Requests for interpretation should state the rule in question, as well as the conditions under which it is being applied. Interpretations are intended to clarify the intent of specific rules and are not intended to supply consulting information on the application of the Code. Requests for interpretation should be submitted using the NESC Interpretation Request Form on the NESC home page: <http://standards.ieee.org/about/nesc/interps.html>.

If the request is suitable for processing, it will be sent to the Interpretations Subcommittee. After consideration by the committee, which may involve many exchanges of correspondence, the inquirer will be notified of its decision. Decisions are published regularly and may be ordered or accessed online at no cost at <http://standards.ieee.org/about/nesc/interps.html>.

The NESC as written is a voluntary standard. However, some editions and some parts of the Code have been adopted, with and without changes, by some state and local jurisdictional authorities. To determine the legal status of the NESC in any particular state or locality within a state, the authority having jurisdiction should be contacted.

Change proposals and comments for the 2017 Editions of the NESC will be submitted to the NESC Secretary online via the Internet. For information on how this electronic revision process will take place and for updates and complete information on the NESC, please visit the National Electrical Safety Code Zone on the IEEE Standards Web site at <http://standards.ieee.org/about/nesc/>.

## Standards Committee Membership

At the time this Code was approved, Accredited Standards Committee C2 had the following membership:

**Michael J. Hyland**, *Chair*  
**James R. Tomaseski**, *Vice Chair*  
**William A. Ash**, *Secretary, 2003–2010*  
**Michael D. Kipness**, *Secretary, 2010–2011*

<i>Organization represented</i>	<i>Principle</i>	<i>Alternate</i>	<i>Employer</i>
Chair	Michael J. Hyland		American Public Power Association
Past Chair	O. Chuck Amrhyn		OPEC
AAR	Robert Verhelle		Amtrak
AEIC	Swapan Dey		NSTAR Electric & Gas Corp.
APPA	Nathan Mitchell		American Public Power Association
APTA	George S. Pristach		Parsons Brinckerhoff
		Billy Raley	Progress Energy
ATIS	Lawrence M. Slavin		Outside Plant Consulting Services, Inc.
BPA	Maggie Emery		Bonneville Power Administration

**Key:**

A = All areas; 1 = Part 1; 2 = Part 2; 3 = Part 3; 4 = Part 4; 9 = Section 9

**Grounding:**

When a member has Section 9 and a part number, the member covers grounding and grounding for that part.

Letter symbols for units .....	xxxix
Sec. 1. Introduction to the National Electrical Safety Code .....	1
010. Purpose.....	1
011. Scope.....	1
A. Covered .....	1
B. Not covered .....	2
C. Types of requirements .....	3
012. General rules.....	4
013. Application.....	4
A. New installations and extensions .....	4
B. Existing installations .....	4
C. Inspection and work rules .....	5
014. Waiver.....	5
A. Emergency installations .....	5
B. Temporary overhead installations .....	5
015. Intent .....	5
016. Effective date .....	6
017. Units of measure .....	6
018. Method of calculation .....	6
Sec. 2. Definitions of special terms .....	7
Sec. 3. References.....	20
Sec. 9. Grounding methods for electric supply and communications facilities.....	22
090. Purpose.....	22
091. Scope.....	22
092. Point of connection of grounding conductor .....	22
A. Direct-current systems that are required to be grounded .....	22
1. 750 V and below .....	22
2. Over 750 V .....	22
B. Alternating current systems that are required to be grounded .....	22
1. 750 V and below .....	22
2. Over 750 V .....	22
3. Separate grounding conductor .....	23
C. Messenger wires and guys .....	23
1. Messenger wires .....	23
2. Guys .....	23
3. Common grounding of messengers and guys on the same supporting structure .....	23
D. Current in grounding conductor .....	24
E. Fences .....	24
093. Grounding conductor and means of connection .....	25
A. Composition of grounding conductors .....	25
B. Connection of grounding conductors .....	25
C. Ampacity and strength .....	25
1. System grounding conductors for single-grounded systems .....	25
2. System grounding conductors for multi-grounded alternating current systems .....	25
3. Grounding conductors for instrument transformers .....	25
4. Grounding conductors for primary surge arresters .....	26
5. Grounding conductors for equipment, messenger wires, and guys .....	26

215. Grounding of circuits, supporting structures, and equipment.....	75
A. Methods .....	75
B. Circuits .....	75
1. Common neutral .....	75
2. Other neutrals .....	75
3. Other conductors .....	75
4. Surge arresters .....	75
5. Use of earth as part of circuit .....	75
C. Non-current-carrying parts .....	75
1. General .....	75
2. Anchor guys and span guys .....	76
3. Span wires carrying luminaires or traffic signals .....	76
4. Use of insulators in anchor guys .....	76
5. Use of insulators in span guys and span wires supporting luminaries and traffic signals .....	76
6. Use of insulators in span wires supporting energized trolley or electric railroad contact conductors .....	76
7. Insulators used to limit galvanic corrosion .....	77
8. Multiple messengers on the same structure .....	77
216. Arrangement of switches .....	77
A. Accessibility .....	77
B. Indicating open or closed position .....	77
C. Locking .....	77
D. Uniform position .....	77
E. Remotely controlled, automatic transmission, or distribution overhead line switching devices .....	77
217. General.....	77
A. Supporting structures .....	77
1. Protection of structures .....	77
2. Readily climbable supporting structures .....	78
3. Identification .....	78
4. Attachments, decorations, and obstructions .....	79
B. Unusual conductor supports .....	79
C. Protection and marking of guys .....	79
218. Vegetation management .....	79
A. General .....	79
B. At line crossings, railroad crossings, limited-access highway crossings, or navigable waterways requiring crossing permits .....	79
Sec. 22. Relations between various classes of lines and equipment.....	80
220. Relative levels.....	80
A. Standardization of levels .....	80
B. Relative levels: supply and communication conductors .....	80
1. Preferred levels .....	80
2. Special construction for supply circuits, the voltage of which is 600 V or less and carrying power not in excess of 5 kW .....	80
C. Relative levels: Supply lines of different voltage classifications (0 to 750 V, over 750 V to 8.7 kV, over 8.7 kV to 22 kV, over 22 kV to 50 kV, and over 50 kV) .....	81
1. At crossings or conflicts .....	81
2. On structures used only by supply conductors .....	81
D. Identification of overhead conductors .....	81
E. Identification of equipment on supporting structures .....	81
221. Avoidance of conflict.....	81

222. Joint use of structures .....	82
223. Communications protective requirements .....	82
A. Where required .....	82
B. Means of protection .....	82
224. Communication circuits located within the supply space and supply circuits located within the communication space .....	82
A. Communication circuits located in the supply space .....	82
B. Supply circuits used exclusively in the operation of communication circuits .....	83
225. Electric railway construction .....	83
A. Trolley-contact conductor fastenings .....	83
B. High-voltage contact conductors .....	84
C. Third rails .....	84
D. Prevention of loss of contact at railroad crossings at grade .....	84
E. Guards under bridges .....	84
Sec. 23. Clearances .....	85
230. General .....	85
A. Application .....	85
1. Permanent and temporary installations .....	85
2. Emergency installations .....	85
3. Measurement of clearance and spacing .....	85
4. Rounding of calculation results .....	86
B. Ice and wind loading for clearances .....	87
C. Supply cables .....	88
D. Covered conductors .....	88
E. Neutral conductors .....	88
F. Fiber-optic cable .....	88
1. Fiber-optic—supply cable .....	88
2. Fiber-optic—communication cable .....	89
G. Alternating- and direct-current circuits .....	89
H. Constant-current circuits .....	89
I. Maintenance of clearances and spacings .....	89
231. Clearances of supporting structures from other objects .....	91
A. From fire hydrants .....	91
B. From streets, roads, and highways .....	91
C. From railroad tracks .....	91
232. Vertical clearances of wires, conductors, cables, and equipment above ground, roadway, rail, or water surfaces .....	91
A. Application .....	91
B. Clearance of wires, conductors, cables, equipment, and support arms mounted on supporting structures .....	92
1. Clearance to wires, conductors, and cables .....	92
2. Clearance to unguarded rigid live parts of equipment .....	92
3. Clearance to support arms, switch handles, and equipment cases .....	92
4. Street and area lighting .....	92
C. Additional clearances for wires, conductors, cables, and unguarded rigid live parts of equipment .....	92
1. Voltages exceeding 22 kV .....	92
D. Alternate clearances for voltages exceeding 98 kV ac to ground or 139 kV dc to ground .....	93
1. Sag conditions of line conductors .....	93
2. Reference heights .....	93
3. Electrical component of clearance .....	93
4. Limit .....	94

<i>Section</i>	<i>Page</i>
233. Clearances between wires, conductors, and cables carried on different supporting structures .....	105
A. General .....	105
1. Conductor movement envelope .....	105
2. Clearance envelope .....	106
B. Horizontal clearance .....	106
1. Clearance requirements .....	106
2. For voltages exceeding 50 kV, the additional clearance specified in Rule 233B1 shall be increased 3% for each 300 m (1000 ft) in excess of 1000 m (3300 ft) above mean sea level .....	106
3. Alternate clearances between conductors of different circuits where one or both circuits exceed 98 kV ac to ground or 139 kV dc to ground .....	106
C. Vertical clearance .....	107
1. Clearance requirements .....	107
2. Voltages exceeding 22 kV .....	107
3. Alternate clearances for voltage exceeding 98 kV ac to ground or 139 kV dc to ground .....	107
234. Clearance of wires, conductors, cables, and equipment from buildings, bridges, rail cars, swimming pools, and other installations .....	116
A. Application .....	116
1. Vertical and horizontal clearances (no wind displacement) .....	116
2. Horizontal clearances (with wind displacement) .....	117
3. Transition between horizontal and vertical clearances .....	117
B. Clearances of wires, conductors, and cables from other supporting structures .....	117
1. Horizontal clearances .....	117
2. Vertical clearances .....	118
C. Clearances of wires, conductors, cables, and rigid live parts from buildings, signs, billboards, chimneys, radio and television antennas, tanks, flagpoles and flags, banners, and other installations except bridges .....	118
1. Vertical and horizontal clearances .....	118
2. Guarding of supply conductors and rigid live parts .....	119
3. Supply conductors attached to buildings or other installations .....	119
4. Communication conductors attached to buildings or other installations .....	120
D. Clearance of wires, conductors, cables, and unguarded rigid live parts from bridges .....	120
1. Vertical and horizontal clearances .....	120
2. Guarding trolley-contact conductors located under bridges .....	121
E. Clearance of wires, conductors, cables, or unguarded rigid live parts installed over or near swimming areas with no wind displacement .....	121
1. Swimming pools .....	121
2. Beaches and waterways restricted to swimming .....	121
3. Waterways subject to water skiing .....	122
F. Clearances of wires, conductors, cables, and rigid live parts from grain bins .....	122
1. Grain bins loaded by permanently installed augers, conveyers, or elevator systems ..	122
2. Grain bins loaded by portable augers, conveyers, or elevators (with no wind displacement) .....	122
G. Additional clearances for voltages exceeding 22 kV for wires, conductors, cables, and unguarded rigid live parts of equipment .....	122
H. Alternate clearances for voltages exceeding 98 kV ac to ground or 139 kV dc to ground .....	123
1. Sag conditions of line conductors .....	123
2. Reference distances .....	123
3. Electrical component of clearance .....	123
4. Limit .....	123
I. Clearance of wires, conductors, and cables to rail cars .....	123

## Contents

<i>Section</i>	<i>Page</i>
J. Clearance of equipment mounted on supporting structures .....	124
1. Clearance to unguarded rigid live parts of equipment .....	124
2. Clearance to equipment cases .....	124
235. Clearance for wires, conductors, or cables carried on the same supporting structure .....	145
A. Application of rule .....	145
1. Multiconductor wires or cables .....	145
2. Conductors supported by messengers or span wires .....	145
3. Line conductors of different circuits .....	145
B. Horizontal clearance between line conductors .....	146
1. Fixed supports .....	146
2. Suspension insulators .....	147
3. Alternate clearances for different circuits where one or both circuits exceed 98 kV ac to ground or 139 kV dc to ground .....	147
C. Vertical clearance between conductors at the support .....	148
1. Basic clearance for conductors of same or different circuits .....	148
2. Additional clearances .....	148
3. Alternate clearances for different circuits where one or both exceed 98 kV ac, or 139 kV dc to ground .....	150
4. Communication worker safety zone .....	151
D. Diagonal clearance between line wires, conductors, and cables located at different levels on the same supporting structure .....	151
E. Clearances in any direction at or near a support from line conductors to supports, and to vertical or lateral conductors, service drops, and span or guy wires, attached to the same support .....	151
1. Fixed supports .....	151
2. Suspension insulators .....	151
3. Alternate clearances for voltages exceeding 98 kV ac to ground or 139 kV dc to ground .....	151
F. Clearances between circuits of different voltage classifications located in the supply space on the same support arm .....	152
G. Conductor spacing: vertical racks or separate brackets .....	153
H. Clearance and spacing between communication conductors, cables, and equipment .....	153
I. Clearances in any direction from supply line conductors to communication antennas in the supply space attached to the same supporting structure .....	153
1. General .....	153
2. Communication antenna .....	153
3. Equipment case that supports or is adjacent to a communication antenna .....	153
4. Vertical or lateral communication conductors and cables attached to a communication antenna .....	153
236. Climbing space .....	171
A. Location and dimensions .....	171
B. Portions of supporting structures in climbing space .....	172
C. Support arm location relative to climbing space .....	172
D. Location of equipment relative to climbing space .....	172
E. Climbing space between conductors .....	172
F. Climbing space on buckarm construction .....	172
G. Climbing space past longitudinal runs not on support arms .....	173
H. Climbing space past vertical conductors .....	173
I. Climbing space near ridge-pin conductors .....	173
237. Working space .....	176
A. Location of working spaces .....	176
B. Dimensions of working spaces .....	176
1. Along the support arm .....	176
2. At right angles to the support arm .....	176

## Contents

<i>Section</i>	<i>Page</i>
3. Vertically .....	176
C. Location of vertical and lateral conductors relative to working spaces .....	176
D. Location of buckarms relative to working spaces .....	176
1. Standard height of working space .....	176
2. Reduced height of working space .....	176
E. Guarding of energized equipment .....	176
F. Working clearances from energized equipment .....	177
238. Vertical clearance between certain communications and supply facilities located on the same structure .....	177
A. Equipment .....	177
B. Clearances in general .....	177
C. Clearances for span wires or brackets .....	177
D. Clearance of drip loops of luminaire or traffic signal brackets .....	177
E. Communication worker safety zone .....	178
239. Clearance of vertical and lateral facilities from other facilities and surfaces on the same supporting structure .....	179
A. General .....	179
B. Location of vertical or lateral conductors relative to climbing spaces, working spaces, and pole steps .....	180
C. Conductors not in conduit .....	180
D. Guarding and protection near ground .....	180
E. Requirements for vertical and lateral supply conductors on supply line structures or within supply space on jointly used structures .....	180
1. General clearances .....	180
2. Special cases .....	180
F. Requirements for vertical and lateral communication conductors on communication line structures or within the communication space on jointly used structures .....	181
1. Clearances from communication conductors .....	181
2. Clearances from supply conductors .....	181
G. Requirements for vertical supply conductors and cables passing through communication space on jointly used line structures .....	181
1. Guarding—General .....	181
2. Cables and conductors in conduit or covering .....	182
3. Protection near trolley, ungrounded traffic signal, or ungrounded luminaire attachments .....	182
4. Aerial services .....	182
5. Clearance from through bolts and other metal objects .....	182
H. Requirements for vertical communication conductors passing through supply space on jointly used structures .....	182
1. Metal-sheathed communication cables .....	182
2. Communication conductors .....	183
3. Communication grounding conductors .....	183
4. Clearance from through bolts and other metal objects .....	183
I. Operating rods .....	183
J. Additional rules for standoff brackets .....	183
Sec. 24. Grades of construction .....	186
240. General .....	186
241. Application of grades of construction to different situations .....	186
A. Supply cables .....	186
B. Order of grades .....	186
C. At crossings .....	186
1. Grade of upper line .....	186

## Contents

<i>Section</i>	<i>Page</i>
2. Grade of lower line .....	186
3. Multiple crossings .....	186
D. Conflicts (see Section 2, <b>structure conflict</b> ) .....	186
242. Grades of construction for conductors .....	187
A. Constant-current circuit conductors .....	187
B. Railway feeder and trolley-contact circuit conductors .....	187
C. Communication circuit conductors and cables .....	187
D. Fire-alarm circuit conductors .....	187
E. Neutral conductors of supply circuits .....	187
F. Surge-protection wires .....	187
243. Grades of construction for line supports .....	189
A. Structures .....	189
B. Crossarms and support arms .....	189
C. Pins, armless construction brackets, insulators, and conductor fastenings .....	189
Sec. 25. Loadings for Grades B and C .....	191
250. General loading requirements and maps .....	191
A. General .....	191
B. Combined ice and wind district loading .....	191
C. Extreme wind loading .....	191
1. Velocity pressure exposure coefficient, $k_z$ .....	192
2. Gust response factor, $G_{RF}$ .....	192
D. Extreme ice with concurrent wind loading .....	193
251. Conductor loading .....	208
A. General .....	208
B. Load components .....	208
1. Vertical load component .....	208
2. Horizontal load component .....	209
3. Total load .....	209
252. Loads on line supports .....	209
A. Assumed vertical loads .....	209
B. Assumed transverse loads .....	210
1. Transverse loads from conductors and messengers .....	210
2. Wind loads on structures .....	210
3. At angles .....	210
4. Span lengths .....	210
C. Assumed longitudinal loading .....	210
1. Change in grade of construction .....	210
2. Jointly used poles at crossings over railroads, communication lines, or limited access highways .....	211
3. Deadends .....	211
4. Unequal spans and unequal vertical loads .....	211
5. Stringing loads .....	211
6. Longitudinal capability .....	211
7. Communication conductors on unguyed supports at railroad and limited access highway crossings .....	211
D. Simultaneous application of loads .....	211
253. Load factors for structures, crossarms, support hardware, guys, foundations, and anchors....	211
Sec. 26. Strength requirements .....	213
260. General (see also Section 20) .....	213
A. Preliminary assumptions .....	213
B. Application of strength factors .....	213

### **Part 3. Safety Rules for the Installation and Maintenance of Underground Electric Supply and Communication Lines**

Sec. 30. Purpose, scope, and application of rules.....	233
300. Purpose.....	233
301. Scope.....	233
302. Application of rules .....	233
Sec. 31. General requirements applying to underground lines .....	234
310. Referenced sections .....	234
311. Installation and maintenance .....	234
312. Accessibility.....	234
313. Inspection and tests of lines and equipment .....	234
A. When in service .....	234
1. Initial compliance with safety rules .....	234
2. Inspection .....	234
3. Tests .....	234
4. Inspection records .....	234

## Contents

<i>Section</i>	<i>Page</i>
5. Corrections .....	234
B. When out of service .....	235
1. Lines infrequently used .....	235
2. Lines temporarily out of service .....	235
3. Lines permanently abandoned .....	235
314. Grounding of circuits and equipment .....	235
A. Methods .....	235
B. Conductive parts to be grounded .....	235
C. Circuits .....	235
1. Neutrals .....	235
2. Other conductors .....	235
3. Surge arresters .....	235
4. Use of earth as part of circuit .....	235
315. Communications protective requirements .....	235
A. Where required .....	235
B. Means of protection .....	236
316. Induced voltage.....	236
 Sec. 32. Underground conduit systems.....	 237
320. Location .....	237
A. Routing .....	237
1. General .....	237
2. Natural hazards .....	237
3. Highways and streets .....	237
4. Bridges and tunnels .....	237
5. Crossing railroad tracks .....	237
6. Submarine crossing .....	237
B. Separation from other underground installations .....	238
1. General .....	238
2. Separations between supply and communication conduit systems .....	238
3. Sewers, sanitary and storm .....	238
4. Water lines .....	238
5. Gas and other lines that transport flammable material .....	238
6. Steam lines .....	238
321. Excavation and backfill .....	238
A. Trench .....	238
B. Quality of backfill .....	238
322. Ducts and joints .....	239
A. General .....	239
B. Installation .....	239
1. Restraint .....	239
2. Joints .....	239
3. Externally coated pipe .....	239
4. Building walls .....	239
5. Bridges .....	239
323. Manholes, handholes, and vaults .....	239
A. Strength .....	239
B. Dimensions .....	240
C. Manhole access .....	240
D. Covers .....	241
E. Vault and utility tunnel access .....	241
F. Ladder requirements .....	241
G. Drainage .....	241
H. Ventilation .....	241

## Letter symbols for units

This Code uses standard symbols for units. They have the following meanings:

A	ampere
C	degree Celsius
ft	foot
ft <sup>2</sup>	square foot
ft <sup>3</sup>	cubic foot
F	degree Fahrenheit
g	gram
Hz	hertz
h	hour
in	inch
in <sup>2</sup>	square inch
k	kilo (10 <sup>3</sup> )
kg	kilogram
kPa	kilopascal
km <sup>2</sup>	square kilometer
kV	kilovolt (1000 volts)
kVA	kilovoltampere
kW	kilowatt
m	meter
m <sup>2</sup>	square meter
m <sup>3</sup>	cubic meter
m	milli (10 <sup>-3</sup> )
mA	milliampere
mi	mile (international)
mm	millimeter
min	minute (time)
N	newton
Pa	pascal
lb	pound
s	second (time)
V	volt
W	watt

## Section 1. Introduction to the National Electrical Safety Code®

The National Electrical Safety Code (NESC®) is American National Standard C2. It is a consensus standard that has been prepared by the National Electrical Safety Code Committee under procedures approved by the American National Standards Institute (ANSI). The membership of the NESC Committee is composed of national and international organizations and is certified by ANSI as having an appropriate balance of the interests of members of the public, utility workers, regulatory agencies, and the various types of private and public utilities.

The NESC is used in whole or in part by statute, regulation, or consent as the standard (or basis of the standard) of safe practice for public and private utilities in the United States, as well various jurisdictions and industries in other countries.

### 010. Purpose

- A. The purpose of the NESC is the practical safeguarding of persons, utility facilities, and affected property during the installation, operation, and maintenance of electric supply and communication facilities, under specified conditions.

*NOTE:* NESC rules are founded upon the fundamental principles used for safety of utility facilities, and the NESC is globally accepted as good engineering practice.

- B. NESC rules contain the basic provisions, under specified conditions, that are considered necessary for the safeguarding of:
  - 1. The public,
  - 2. Utility workers (employees and contractors),
  - 3. Utility facilities,
  - 4. Electric supply and communication equipment connected to utility facilities, and
  - 5. Other facilities or premises adjacent to or containing utility facilities.
- C. NESC rules are intended to provide a standard of safe practices that can be adopted by public utilities, private utilities, state or local utility commissions or public service commissions, or other boards or bodies having control over safe practices employed in the design, installation, operation, and maintenance of electric supply, communication, street and area lighting, signal, or railroad utility facilities.
- D. This Code is not intended as a design specification or as an instruction manual.

### 011. Scope

- A. Covered

See Figure 011-1.

The NESC covers:

- 1. Supply and communication facilities (including metering) and associated work practices employed by a public or private electric supply, communications, railway, trolley, street and area lighting, traffic signal (or other signal), irrigation district or other community owned utility, or a similar utility in the exercise of its function as a utility.
- 2. The generation, transmission, and distribution of electricity, lumens, communication signals, and communication data through public and private utility systems that are installed and maintained under the exclusive control of utilities or their authorized representatives.
